a new quality of attractiveness*

Quicklear®-Brackets

2nd Generation

New!

The locking clip has a dull, polished surface which reduces reflection to ensure that the clip is even less conspicuous

New!

The bracket and slot edges have been rounded much more to provide for noticeably enhanced patient comfort and reduced friction

New!

Now available for maxillary 5-5 and mandibular 3-3

QuicKlear®-Brackets

Invisible and fast

In creating the 2nd generation of QuicKlear® bracket, Forestadent have been able to further enhance the ceramic version of the well-established Quick-System. Owing to the new type of surface conditioning, the metal clip now looks dull rather than shining to ensure that it is much more inconspicuous. The edges of the brackets and slots have been rounded much more to reduce friction and increase patient comfort noticeably. 2nd generation QuicKlear® brackets are now also available for the mandible to provide all-round aesthetics

The QuicKlear® bracket is a self-ligating, tooth-coloured, ceramic bracket which is the perfect aesthetic complement to the Bio-Quick® bracket system. The QuicKlear® is an active bracket. It features the proven and familiar closing mechanism of the Quick® bracket systems to allow for short chairside times. Its outstanding aesthetics promise a natural smile. Ideal conditions for satisfying patients.

Optimum aesthetics

The QuicKlear® provides orthodontists with a twin-winged bracket which promotes the natural aesthetics of each and every patient. Thanks to their tooth-coloured ceramic - developed by Forestadent - QuicKlear® brackets blend optically with the tooth. The small locking clip consists of chromium-cobalt which, unlike acrylic, will not discolour. The surface of the 2nd generation clip is polished dull to reduce reflection considerably and thus become hardly noticeable. Available to date for maxillary teeth 5 to 5, QuicKlear® is now also available for mandibular

teeth 3 to 3 so that patients can show their smile without having to think twice.

Convenient for both patient and operator

The rounded edges on the bracket and slot provide for patient comfort. These have been rounded even more on the 2nd generation QuicKlear® brackets to cause even less friction. The proven locking technique used for Quick bracket systems is convenient for the orthodontist: Two integrated mechanisms guarantee that the locking clip can be

Rounded slot edges and a four contact point slot provide minimal friction

opened easily and gently towards the occlusal aspect. The clip is now easier to open from the vestibular or gingival aspects. The especially widely-shaped guidance funnel and guidance grooves facilitate opening the clip with a probe from the gingival aspect. The clip can be closed by exerting gentle finger-pressure. The brief chairside times are pleasant for both orthodontists and patients.

Distinctive funnel for easy opening of the QuickKlear® brackets

High retention, easily removed

A patented bracket base developed specifically for QuickKlear® ensures easy and safe handling:

- The hook-style base developed by Forestadent has been inverted for ceramic brackets. This bracket base includes bevelled edges and diametrically offset retaining holes for purely mechanical retention. Therefore, the QuickKlear® bracket not only provides for excellent bond strength on the tooth, but can also be debonded trouble-free following treatment as it has no ceramic hooks which may fracture and be trapped in the adhesive. Enamel chipping is prevented as most of the adhesive remains on the tooth after debonding

New inverse hook-style base

Splinter-proof debonding with the QuickKlear® bracket removing tool

- Mesio-distal bevelled edges on the bracket base guarantee safe, splinter-proof debonding using the special Pauls debonding tool. Alternatively, modified bracket debonding pliers may also be used.

Adhesive remains on the tooth after debonding of the QuickKlear® brackets

Bracket base after debonding a QuickKlear® bracket

Perfect combination of aesthetics, precision and gentle forces

For treatment in the upper and lower aesthetic zones we recommend QuickKlear® brackets combined with BioQuick® metal brackets on the lower premolars. This simplifies introduction into your daily practice without the need for costly, time-consuming changes in treatment procedures. When using other brackets in combination with the QuickKlear® system compensation bends may be necessary, especially when using thicker wires.

The precisely rounded slot edges of the QuickKlear® and BioQuick® brackets even allow the use of tooth-shade coated archwires. To date, they were not indicated for use with metal and ceramic slots due to their sensitive surfaces. To achieve perfect aesthetics in the maxilla we recommend the use and regular replacement of Titanol® Cosmetic archwires or the new BioCosmetic® archwires with a much longer-lasting coating. Neither version may be bent or adapted as pointed tools may damage their tooth-coloured coating.

BioCosmetic® archwires

BioStarter® and BioTorque® archwires, recommended for extended intervals or compensatory bending, provide for minimal forces, reduced friction and perfect force transmission.

Regardless of which type of archwire is in use, it is easily and quickly placed in the bracket slot using the new Quick archwire instrument. This special tool is suitable for use with Quick and QuickKlear® brackets.

Easy and quick placing of the archwire using the new Quick archwire instrument.
